MANI, INC.

**"JIZAI 020 04" Launch:  
A New NiTi Rotary File Joins JIZAI Series for Root Canal Treatment**

– For Safe and Comfortable Dental Treatment –

MANI, Inc. proudly announces the release of a new NiTi Rotary File for root canal treatment, "JIZAI 020 04," in Japan on September 24, with a global rollout planned sequentially. The JIZAI 020 04 is a new addition to the MANI NiTi Rotary File JIZAI series, carrying forward the previous features of "high durability and flexibility" while also expanding the lineup to meet the needs of dental professionals, aiming to provide safer and more comfortable root canal treatments.

## JIZAI Pre 020

NiTi rotary files are medical devices used to remove infected or inflamed dental pulp and tissue inside the tooth. These files are attached to an endo motor and rotated inside the root canal to remove affected dentin. Root canal treatments using NiTi rotary files are minimally invasive and save treatment time, thus lowering the burden on both dentists and patients. As a result, the percentage of doctors introducing NiTi files into their practice is growing.

In root canal treatment, it is crucial that instruments do not break within the canal and that the original shape of the canal is maintained. The newly launched JIZAI 020 04, with its unique heat treatment and cross-sectional design, offers strong resistance to fatigue fractures and high adaptability to the original root canal. Furthermore, by adding the JIZAI 020 04 to the existing JIZAI series, we believe we can better address challenging cases, such as calcified canals, constricted canals, and severely curved root canals.

MANI, Inc. will continue to expand its lineup of endodontic products, including the JIZAI series, to protect the healthy teeth and happy smiles worldwide, contributing to the provision of safe and trusted dental care.
