Notice Regarding the Launch of the New SPIDER+ App for Construction Digital Transformation

The Company announces that it has launched a fully renewed version of its SPIDER+ app.

The new SPIDER+ improves convenience through new features that reflect customer requests, such as an offline mode and a co-editing function, and a complete redesign of its screens. The Company has also renewed the development foundation to increase the speed and scalability of future feature additions and improvements.

Through the new SPIDER+, the Company aims to further improve productivity at construction sites, expand business with existing customers and acquire new customers, and thereby increase its corporate value over the medium to long term.

For the background and features of the new app, please refer to the excerpt from the Company's press release below.

Press release excerpt

SpiderPlus & Co. Announces General Availability of the Fully Renewed SPIDER+ App

A redesigned UI and improved UX, based on knowledge built up over many years at construction sites. A next-generation SPIDER+ that reduces waiting time on site and can be used intuitively, without confusion.

SpiderPlus & Co. (Head office: Minato-ku, Tokyo; Representative: Kenji Ito; "SpiderPlus") announces that it has fully renewed its digital transformation app for the construction industry, SPIDER+, and will make it generally available from November 17, 2026.

SpiderPlus has rebuilt, from the ground up, the foundation of the previous app used at construction sites across Japan. It has redesigned the UI, including ease of operation and readability, and greatly improved the UX. The move to the new foundation will be carried out in stages to minimize the impact on sites.

■ Background of the renewal

SpiderPlus has decided to rebuild the app from the ground up to fully resolve the technical constraints that had built up over many years of operation. SPIDER+ was launched in September 2011 to improve operational efficiency for customers in the construction industry, and it has been used at many sites for more than 15 years.

■ Main features

1. Faster response and intuitive operation

The renewal removes heavy processing, greatly improving response speed across the app and reducing waiting time in daily work. At construction sites, where large volumes of drawings and photos are handled, a slow or delayed app lowers work efficiency. The UI has also been redesigned to improve the UX, so that input and checking work on site can be done more smoothly and the app is intuitive to operate.

2. An offline mode that works regardless of network conditions, and expanded basic functions

An offline mode has been added so that work is not affected in places with unstable connections, such as underground or at height. Users can check drawings and record work smoothly without worrying about signal strength.

In addition, where a network connection is available, a new co-editing function allows multiple people to write on the same drawing memo at the same time on iPad or iPhone, with automatic synchronization. This makes it easier to share the latest status between the site and the office, or among multiple site staff, and reduces the time previously spent checking and waiting.

Other improvements in the new app are introduced in the videos below.

■ Technical initiatives

Rebuilding an app operated and updated for more than 15 years from the ground up

SpiderPlus has operated and updated the previous app for more than 15 years. This time, SpiderPlus has rebuilt it from the ground up as a fundamentally different app. Behind this are sound technology choices based on a deep understanding of the construction domain, and a more efficient development process through AI-Driven Development.

Since its founding as a construction company, SpiderPlus has used its knowledge of issues at construction sites to develop its digital transformation business for the construction industry. It drew on the industry-specific business knowledge and understanding of site issues gained over this time in its technology choices, and built a foundation that fits actual work.

Quality assurance and faster improvement through AI-Driven Development

SpiderPlus adopted AI-Driven Development in its development process and completed a large-scale rebuild while strengthening quality assurance in code review and testing. It now has a structure in place to continue adding features and improving quality quickly.

Migration to Flutter and multi-platform support

SpiderPlus has moved its development foundation to Flutter. This prepares for Liquid Glass, the new iOS design language that apps will be required to support in 2027, and also for multi-platform support. SPIDER+ has so far been available only on iOS, but the new foundation is being built with use on Android in mind, which will allow the app to be introduced at a wider range of sites.

■ Toward solving issues in the construction industry

SPIDER+ was originally developed to solve issues and improve efficiency at construction sites, based on SpiderPlus's own experience in construction work. Its practicality as a product comes directly from working with customers to build something "truly usable" at large non-residential construction sites.

SpiderPlus will guide customers through the move to the new app in stages, giving priority to minimizing the impact on their site operations. The new app is currently available in Japanese only.

With this renewal, SpiderPlus will continue to expand features to help solve issues across the construction industry, such as labor shortages, skills transfer and productivity improvement.

■ SPIDER+ app overview

Item	Details
Product name	SPIDER+
Launch date	November 17, 2026 (availability expanding in stages)
Supported OS	iOS (iPad and iPhone). Android support is planned; the timing will be announced once decided.
